

Iranian Fresh Green Kiwi

Hayward variety, grown on the Caspian belt, specified and packed for the European Union market.

IDENTITY

BOTANICAL NAME

Actinidia deliciosa

VARIETY

Hayward

HS CODE

0810.50

ORIGIN

Iran

PRODUCT FORM

Fresh, whole fruit

MARKET

European Union

HARVEST

Oct – Dec

CLASSES

Extra / I / II

CALIBRES

30 – 60

One page for the buyer who already knows kiwi.

Everything below is specified in full later in this document. This page exists so a procurement desk can decide in ninety seconds whether to keep reading.

QUALITY & GRADING

01

Three EU classes

Extra, Class I and Class II under the EU/UNECE marketing standard, separated by minimum fruit weight — 90 g, 70 g and 65 g.

02

Calibres 30 – 60

Class follows weight, not preference. Calibres 54 and 60 sit below the 70 g Class I floor and are declared Class II.

03

Zero tolerance

Rot, visible mould, serious bruising and insect damage are not permitted at any class.

MATURITY, COLD CHAIN, COMPLIANCE

04

6.2 – 9.0 °Brix at packing

Or 15–17 % dry matter. Either target on its own demonstrates commercial maturity; they are not cumulative.

05

0 – 1 °C, 90 – 95 % RH

Pre-cooled to 0–2 °C before loading, shipped in a 40 ft reefer. Indicative shelf life 3–4 months under controlled storage.

06

EU phytosanitary certificate

Mandatory for fresh Actinidia since September 2019, issued per destination country. Full EU MRL compliance.

BULK FORMAT

10 kg carton

MEDIUM FORMAT

5 / 5.5 kg carton

RETAIL FORMAT

500 g / 1 kg

PALLET

1200 × 800 mm

Full technical specification — traceability, carton and pallet detail, labelling and phytosanitary basis — is set out on the following pages and available as a standalone document.

Kiwi is a Caspian crop, not an Iranian one.

Iran grows kiwi in one place that matters: the humid subtropical strip between the Alborz range and the Caspian Sea. Mazandaran and Gilan have the rainfall, the mild winters and the long autumn that Hayward needs.

That geography is the commercial argument. Hayward harvested on the Caspian belt comes in late — October into December — which places Iranian fruit in the window after the Southern Hemisphere season closes and before European stock is fully in distribution.

It also explains why this document spends most of its length on maturity and cold chain. A late-harvested kiwi with good dry matter stores well; the same fruit picked early and handled warm does not. The origin gives us the potential. Post-harvest discipline is what delivers it.

FIG. 01 — The Caspian growing belt. Kiwi is not sourced outside this strip; no other Iranian region offers the humidity Hayward requires.

WHAT THE CASPIAN BELT GIVES HAYWARD

01 Humidity

Hayward does not tolerate dry heat. The Caspian strip holds the humidity the vine needs through the growing season.

02 A long autumn

Dry matter accumulates late. A mild autumn lets fruit stay on the vine long enough to reach it.

03 A late window

Harvest from October places Iranian fruit between the Southern Hemisphere season closing and European stock reaching distribution.

FIG. 02 — Hayward: green flesh, radial seed pattern, brown hairy skin.

GROWING REGION

Mazandaran and Gilan — the Caspian belt, between the Alborz range and the sea.

HARVEST WINDOW

October to December, with storage extending supply into the following spring.

Sound, clean, firm — and defined in writing.

Fruit shall be sound, clean, firm, free from visible decay, major mechanical damage, abnormal external moisture, pests and significant physiological defects, and suitable for long-distance transport and subsequent ripening.

ATTRIBUTES

Variety	HAYWARD	Rot	NOT PERMITTED
Shape	TYPICAL, REASONABLY UNIFORM	Visible mould	NOT PERMITTED
Flesh	GREEN, FREE OF INTERNAL DEFECTS	Serious bruising	NOT PERMITTED
Skin	BROWN, NATURALLY HAIRY, UNDAMAGED	Insect damage	NOT PERMITTED
Internal condition	SOUND, NO BREAKDOWN	Foreign material	NOT PERMITTED
		Abnormal external moisture	NOT PERMITTED
		Off-odour	NOT PERMITTED

EU / UNECE CLASSES, BY MINIMUM FRUIT WEIGHT

90_g

Extra

Minimum fruit weight. Calibres 30 to 42.

70_g

Class I

Minimum fruit weight. Calibres 42 to 48.

65_g

Class II

Minimum fruit weight. Calibres 54 and 60.

The product shall comply with the applicable EU/UNECE marketing standard for kiwifruit. Class is determined by weight; it is not a commercial preference.

Calibre is weight. Weight is class.

Calibre is the fruit count per standard package, so a lower number means a heavier fruit. Each bar below is the calibre's weight band, plotted against the three EU class thresholds. Where a bar sits decides its class.

EXTRA • CALIBRES 30–42

At or above the 90 g minimum. The premium size band, and the one most European programmes are written around.

CLASS I • CALIBRES 42–48

At or above 70 g. Calibre 42 straddles the boundary and is declared according to the lot's actual average weight.

CLASS II • CALIBRES 54–60

Between 65 g and 72 g — below the Class I floor. Sound fruit, correctly declared. Not marketed as Class I.

WHY CALIBRE 42 IS SPLIT

Its 88–94 g band crosses the 90 g Extra threshold. A lot averaging 91 g is Extra; the same calibre averaging 89 g is Class I. The declaration follows the lot's measured average weight, not the calibre number.

WHAT TO SPECIFY

Give us the calibre and the class you need and we will tell you whether the season can hold both. Where it cannot, we propose the adjacent calibre rather than re-labelling the one we have.

DECLARED PER SHIPMENT

Calibre • average fruit weight • net carton weight • number of fruits per carton • applicable class. Mixed shipments state the class per calibre on the carton label.

Calibre to class, reconciled.

Approximate weight bands are indicative and shall be confirmed against the packing-house calibration record for each lot.

CAL	WEIGHT RANGE	CLASS	NOTE	FRUIT
30	≥ 125 g	Extra	Largest commercial calibre.	Heaviest
33	115 – 124 g	Extra	—	↑
36	105 – 114 g	Extra	—	↑
39	95 – 104 g	Extra	—	↑
42	88 – 94 g	Extra / Class I	Straddles the 90 g Extra threshold; declared on the lot's actual average weight.	↑
45	80 – 87 g	Class I	—	↓
48	73 – 79 g	Class I	Lower end of the Class I range.	↓
54	68 – 72 g	Class II	Below the Extra / Class I weight floor of 70 g.	↓
60	65 – 67 g	Class II	At the Class II minimum weight.	Lightest

MIXED SHIPMENTS

A consignment containing only calibres 30–48 may be declared Extra or Class I as applicable. Where calibres are mixed across classes, the class is stated per calibre on the carton label.

WHY THIS MATTERS

Calibres 54 and 60 fall below the 70 g Class I threshold. Declaring them as Class I is a marketing-standard breach, not a grading judgement — so we do not do it.

Grading is mechanical or manual against calibrated commercial size. Weight bands are indicative; the packing-house calibration record governs.

Either target, not both.

Meeting the soluble solids target or the dry matter target — not necessarily both at once — is sufficient to demonstrate commercial maturity, consistent with the EU marketing standard.

Soluble Solids Content (SSC)

6.2 – 9.0 °Brix at packing

The EU legal minimum is 6.2 °Brix at packing, rising to 9.5 °Brix by entry into distribution. This specification sets 6.2 °Brix as the floor and 9.0 °Brix as the practical ceiling at packing. Kiwifruit continues to ripen in storage — SSC at harvest is not SSC at consumption. Measured by calibrated digital refractometry.

Dry Matter (DM)

15 – 17 % at packing

The EU legal minimum is 15 % average dry matter at packing. Dry matter is measured as part of the harvest maturity control programme and monitored as a leading indicator of eating quality, with the final commercial specification established after validation trials.

Firmness

≥ 60 – 70 N at packing

Measured with a calibrated penetrometer on a consistent test method. Lot-specific and subject to validation for the storage programme and buyer requirement. A firmness record is maintained for each production lot.

MEASURED, PER LOT

Readings belong to a production lot and travel with it. A shipment-level average hides the lot that will fail.

STORAGE CHANGES THE NUMBER

Kiwifruit keeps ripening in store. A Brix figure is only meaningful with the date and the stage it was taken at.

SET THE LIMITS TOGETHER

Final acceptance limits are agreed with the buyer: maturity requirements vary with storage duration and destination.

SSC AT PACKING

6.2 – 9.0 °Bx

DRY MATTER

15 – 17 %

FIRMNESS

≥ 60 – 70 N

RULE

Either, not both

Every number on the previous page is an instrument reading.

Brix comes off a calibrated refractometer. Firmness comes off a calibrated penetrometer. Residues come off an accredited laboratory report. None of it is a claim we make about ourselves.

INSTRUMENT 01

Digital refractometer

Soluble solids at packing, on a calibrated instrument. Recorded per lot, not per shipment.

INSTRUMENT 02

Penetrometer

Firmness in newtons, consistent test method, calibrated. A firmness record follows each production lot.

INSTRUMENT 03

Accredited laboratory

Multiresidue pesticide panel against EU MRLs, with laboratory accreditation details and sample identification.

“A specification is only worth the measurement behind it. Ask us for the records — they exist because they are made routinely, not because you asked.”

Compliance is documented, or it has not happened.

All fruit shall comply with the applicable EU Maximum Residue Levels for pesticides. Target: no MRL exceedances.

PROVIDED PER EXPORT LOT, WHERE REQUIRED

- | | |
|----|--|
| 01 | Multiresidue pesticide analysis
Accredited laboratory report covering the relevant pesticide panel for the destination market. |
| 02 | Heavy-metal analysis
Where specified by the buyer or required by the destination. |
| 03 | Microbiological analysis
Where applicable to the product and programme. |
| 04 | Report identification
Laboratory accreditation details, sample and lot identification, and date of analysis on every report. |

PREFERRED CERTIFICATION PACKAGE

- | | |
|---|--|
| A | GLOBALG.A.P.
Primary production certification at orchard level. |
| B | GRASP
Social practice assessment, where applicable to the programme. |
| C | BRCGS / IFS / FSSC 22000
Packhouse food-safety certification, selected according to buyer requirement. |
| D | HACCP-based system
Food-safety management across handling, packing and storage. |

Certification requirements are confirmed with each buyer before contracting. We name what is held; we do not imply certification we do not hold.

RESIDUE TARGET

No MRL exceedance

TRACEABILITY

Orchard to carton

LAB REPORTS

Per export lot

BASIS

EU MRL regulation

Every carton walks back to a tree.

Each carton shall be traceable through five links. If any one of them is missing, the chain is not a chain.

LINK 01 Exporter The party on the contract and the phytosanitary certificate.	LINK 02 Packhouse Where grading, calibration and packing were carried out.	LINK 03 Production lot The unit that carries the quality and treatment records.	LINK 04 Orchard / producer Named grower and orchard code, not a district or a region.	LINK 05 Harvest date The date the maturity readings belong to.
---	--	---	---	--

RECORDS RETAINED AGAINST EVERY LOT

Producer code	Orchard code	Variety	Harvest date
Packing date	Lot number	Calibre	Packhouse
Treatment records	Storage records	Firmness record	Residue analysis

WHY FIVE LINKS AND NOT THREE

A complaint that reaches us three months after arrival is only answerable if the lot, the orchard and the harvest date are still attached to the carton number. Traceability is a claims tool before it is a compliance one.

FIG. 03 — Records are made in the field, at the point the fruit is assessed.

Three formats, chosen by who opens the carton.

Packaging shall protect the fruit from mechanical damage through handling, transport and storage — and shall suit the party who takes delivery.

LOOSE · 10 KG NET

FORMAT A · BULK

10 kg carton

Loose-packed fruit, suitable for importer or wholesaler repacking. The format that moves volume with the fewest handling steps.

1-2 LAYERS · 5 / 5.5 KG

FORMAT B · MEDIUM

5 / 5.5 kg carton

Single or double layer according to calibre. The working format for service wholesale and for retail programmes that repack on arrival.

TRAY · PUNNET · FLOW-PACK

FORMAT C · RETAIL

500 g / 1 kg pack

Tray, punnet or flow-pack to customer specification, under the PAYA ORIGIN brand or your private label.

FORMAT DECIDES MORE THAN THE BOX

A 10 kg bulk carton and a 5 kg two-layer carton do not take the same calibres, do not palletise the same way, and do not give the same container count. Choosing the format is the first commercial decision in the order, not the last.

CHOSEN WITH THE ORDER

Format is agreed with the specification, not after it — it drives calibre selection and pallet configuration.

LABELLING

Buyer-approved artwork, with lot identification and traceability code on every carton. See page 15.

PRIVATE LABEL

Available across all three formats, to your artwork, language and destination compliance marks.

The carton is a structural component.

It has to hold compression in a stacked pallet, let cold air through, and survive the humidity of a reefer for four weeks. Artwork is the last of its jobs, not the first.

CARTON SPECIFICATION

Board	FOOD-GRADE CORRUGATED
Compression strength	ADEQUATE FOR PALLET STACKING
Ventilation	OPENINGS FOR COLD-CHAIN CIRCULATION
Moisture resistance	WHERE REQUIRED
Materials	FOOD-CONTACT COMPLIANT
Artwork	BUYER-APPROVED
Identification	LOT AND TRACEABILITY CODE

Exact carton dimensions and board specification are agreed with the buyer; they follow from the format, the calibre and the pallet plan.

TARGET PALLET · 1200 × 800 MM

PALLET CONFIGURATION SHALL ENSURE

Carton stability · adequate ventilation · no excessive compression · safe forklift handling · container compatibility.

Alternative pallet formats may be used according to destination or customer requirement. Pallet treatment and marking comply with applicable international requirements.

CONFIGURATION IS AGREED, NOT ASSUMED

Cartons per layer and layers per pallet are fixed with the carton drawing. Changing one changes the container count.

VENTILATION IS STRUCTURAL

A tie pattern that blocks the vent holes defeats the pre-cooling. Stability and airflow are solved together.

COMPRESSION HAS A LIMIT

Board grade is chosen for the stack height, not the single carton. Under-specified board fails in the middle layers.

The carton footprint shown is indicative. The loading plan for each shipment states pallets, cartons per pallet, total cartons, and net and gross kilograms per container — see page 14.

The cold chain starts in the orchard, not the warehouse.

It shall begin as soon as commercially practicable after harvest and be maintained unbroken to discharge. Temperature records are available for every shipment.

SHELF LIFE – INDICATIVE 3 TO 4 MONTHS

Under controlled cold storage, subject to harvest maturity, dry matter, firmness, pre-cooling, storage conditions, ethylene management and cold-chain integrity. Longer storage periods should only be claimed following commercial validation trials on the specific Iranian product.

ON IRANIAN HAYWARD SPECIFICALLY

Research on Iranian Hayward has demonstrated good storage potential under controlled cold-storage conditions — but performance is strongly influenced by harvest maturity and post-harvest handling. The variety is not the guarantee; the programme is.

STORAGE TEMPERATURE

0-1°C

RELATIVE HUMIDITY

90-95 %

PULP TEMP. AT LOADING

0-2 °C

INDICATIVE SHELF LIFE

3-4 months

A loading plan, not an estimate.

Recommended container: 40-foot refrigerated (reefer). Commercial loading is determined per shipment rather than quoted as a standing figure — because carton dimensions and pallet configuration change it.

LOADING IS DETERMINED BY

INPUT 01	INPUT 02	INPUT 03	INPUT 04	INPUT 05
Carton dimensions Footprint and height as built.	Pallet configuration Cartons per layer and layers per pallet.	Net carton weight 10 kg, 5.5 kg or 5 kg by format.	Maximum payload Container and route limits.	Shipping line rules Set point, stowage and documentation.

THE FINAL LOADING PLAN STATES

01	Number of pallets Per container, at the agreed pallet format.	PALLETS
02	Cartons per pallet Layers × cartons per layer, with the tie pattern.	CARTONS/PLT
03	Total cartons The figure the invoice and packing list are built on.	TOTAL
04	Net and gross kilograms Per container, reconciled against the payload	

We do not publish a standing cartons-per-container figure. Any number quoted before the carton is specified is a guess, and a buyer planning a programme around it will be short.

FIG. 05 — Dispatch. Freight is booked against a production plan.

What has to be on the carton.

FIG. 06 — Indicative carton label. Field values shown are examples; class and calibre are stated per lot, and mixed shipments state class per calibre.

REQUIRED FIELDS

Product	FRESH GREEN KIWI
Variety	HAYWARD
Class	EXTRA / I / II
Calibre	XX
Net weight	XX KG
Country of origin	IRAN
Producer / packer	XXXXX
Lot number	XXXXX
Packing date	DD / MM / YYYY
Traceability code	XXXXX

RETAILER-SPECIFIC LABELLING

Additional labels — retailer article codes, GS1 barcodes, destination-language marks — are added to customer requirement on top of the fields above.

A phytosanitary certificate, issued for one destination.

Every shipment shall comply with the phytosanitary requirements applicable to entry into the European Union and be accompanied by the required certificate.

LEGAL BASIS

Fresh *Actinidia* fruit was added, from 1 September 2019, to the list of products requiring a mandatory phytosanitary certificate for entry into the EU — amendment (EU) 2019/523 to Council Directive 2000/29/EC, now consolidated under Implementing Regulation (EU) 2019/2072. Kiwi is not among the five exempt products (pineapple, banana, coconut, durian, date).

IRANIAN EXPORT-SIDE PROCESS

01 Declaration at export customs

The consignment is declared at the customs office of export prior to loading.

02 PPOI inspection

Inspection by the Plant Protection Organization of Iran; where necessary the lot is treated or disinfected.

03 Certificate issued

Issued according to the destination country's stated quarantine conditions.

DESTINATION-SPECIFIC — READ THIS BEFORE A NEW MARKET

The certificate is issued for a specific destination country and commodity. A certificate obtained for one EU member state **cannot** be substituted for another. Any member-state-specific Additional Declaration required for *Actinidia* spp. should be confirmed with PPOI and cross-checked against the current consolidated text of Regulation (EU) 2019/2072 and TRACES NT before the first shipment to a new destination.

ON BACTERIAL CANKER (PSA)

Pseudomonas syringae pv. *actinidiae* is the main quarantine-relevant disease of *Actinidia* worldwide. It spreads via nursery stock — plants for planting — and pollen. There is no recognised pathway of introduction via fresh kiwifruit, so it is not expected to generate additional certification burden for fruit-only shipments.

This specification does not replace confirmation of the current EU pest list by PPOI or a customs consultant prior to each shipment. Regulatory text is cited as at the revision date of this document and should be verified against the consolidated version in force.

REGULATION

(EU) 2019/2072

The one-page export summary in the four languages of our European buyers. Figures are identical across all four; only the language changes.

EN Iranian Fresh Green Kiwi

Export Summary — Hayward Variety — European Union Market · *Actinidia deliciosa* · HS 0810.50 · Origin: Iran · Fresh, whole fruit

QUALITY & GRADING

- Classes: Extra / Class I / Class II (EU-UNECE)
- Calibres 30–60, matched to class by weight
- Class II applies to calibres 54 & 60 (65–72 g)
- Zero tolerance: rot, mould, serious bruising, insect damage

MATURITY

- SSC: 6.2–9.0 °Brix at packing
- Dry matter: 15–17 % at packing
- Firmness: ≥ 60–70 N at packing
- Either SSC or DM target is sufficient to confirm maturity

COLD CHAIN & SHELF LIFE

- Storage: 0–1 °C / 90–95 % RH
- Pre-cooling to 0–2 °C before loading
- Shipping: 40 ft reefer container
- Indicative shelf life: 3–4 months under controlled storage

CERTIFICATION & COMPLIANCE

- GLOBALG.A.P. / GRASP
- BRCS / IFS / FSSC 22000 (packhouse, per buyer)
- HACCP-based food safety system
- EU phytosanitary certificate (Reg. (EU) 2019/2072)
- Full residue compliance with EU MRLs

BULK

10 kg net carton, loose-packed

MEDIUM

5 / 5.5 kg carton, single or double layer

RETAIL

500 g / 1 kg tray, punnet or flow-pack

DE Iranische frische grüne Kiwi

Exportübersicht — Sorte Hayward — Markt Europäische Union · *Actinidia deliciosa* · HS 0810.50 · Herkunft: Iran · Frisch, ganze Frucht

QUALITÄT & KLASSIFIZIERUNG

- Klassen: Extra / Klasse I / Klasse II (EU-UNECE)
- Kaliber 30–60, je nach Gewicht der Klasse zugeordnet
- Klasse II gilt für die Kaliber 54 und 60 (65–72 g)
- Nulltoleranz: Fäulnis, Schimmel, starke Druckstellen, Insektenschäden

REIFE

- Löslicher Zuckergehalt (SSC): 6,2–9,0 °Brix bei Verpackung
- Trockenmasse: 15–17 % bei Verpackung
- Festigkeit: ≥ 60–70 N bei Verpackung
- Entweder der SSC- oder der Trockenmasse-Zielwert genügt zum Reifenachweis

KÜHLKETTE & HALTBARKEIT

- Lagerung: 0–1 °C / 90–95 % relative Luftfeuchtigkeit
- Vorkühlung auf 0–2 °C vor der Verladung
- Transport: 40-Fuß-Kühlcontainer
- Richtwert Haltbarkeit: 3–4 Monate bei kontrollierter Lagerung

ZERTIFIZIERUNG & KONFORMITÄT

- GLOBALG.A.P. / GRASP
- BRCS / IFS / FSSC 22000 (Packhaus, je nach Käuferanforderung)
- HACCP-basiertes Lebensmittelsicherheitssystem
- EU-Pflanzengesundheitszeugnis (Verordnung (EU) 2019/2072)
- Vollständige Einhaltung der EU-Rückstandshöchstgehalte (MRL)

LOSE WARE

10-kg-Nettokarton, lose verpackt

MITTLERES FORMAT

5-/5,5-kg-Karton, ein- oder zweilagig

EINZELHANDEL

500-g-/1-kg-Schale, Punnet oder Flowpack

Die vollständige technische Spezifikation (Rückverfolgbarkeit, Karton-/Palettendetails, Kennzeichnung, phytosanitäre Grundlage) ist auf Anfrage erhältlich.

Resumen de exportación — Variedad Hayward — Mercado de la Unión Europea · *Actinidia deliciosa* · SA 0810.50 · Origen: Irán · Fruta fresca entera

CALIDAD Y CLASIFICACIÓN

- Categorías: Extra / Categoría I / Categoría II (UE-CEPE)
- Calibres 30–60, asignados a la categoría según el peso
- La Categoría II corresponde a los calibres 54 y 60 (65–72 g)
- Tolerancia cero: podredumbre, moho, magulladuras graves, daños por insectos

MADUREZ

- Sólidos solubles (SSC): 6,2–9,0 °Brix en el envasado
- Materia seca: 15–17 % en el envasado
- Firmeza: ≥ 60–70 N en el envasado
- Basta con alcanzar el objetivo de SSC o de materia seca para confirmar la madurez

CADENA DE FRÍO Y VIDA ÚTIL

- Almacenamiento: 0–1 °C / 90–95 % HR
- Preenfriado a 0–2 °C antes de la carga
- Transporte: contenedor refrigerado de 40 pies
- Vida útil indicativa: 3–4 meses en almacenamiento controlado

CERTIFICACIÓN Y CUMPLIMIENTO

- GLOBALG.A.P. / GRASP
- BRCS / IFS / FSSC 22000 (central hortofrutícola, según comprador)
- Sistema de seguridad alimentaria basado en APPCC
- Certificado fitosanitario de la UE (Reglamento (UE) 2019/2072)
- Cumplimiento total de los LMR de la UE
